# EXECUTIVE SUMMARY OF THE PROJECT

## Synopsis

The mini project made by us is basically a demonstration of the banking systems around the world on a very basic scale, in which we have created an GUI (Graphic User Interface) using the eclipse platform of the JAVA and using the file management systems in JAVA. In it basically we have provided an interface to add, delete and view the different many accountants of a particular branch of a bank and also to add , delete and view the different bank holders and also store their account number , contact numbers and salaries in the file , just to use whenever required . We have used the file management system in JAVA to store the details of all the accountants and the account holders.

## Introduction

The application that is the essence of the project works by defining various classes that even have further subclasses so as to modularize the final code. The code is written in a neat fashion with appropriate documentation. It provides a smooth, unfaltering user experience so as to facilitate its use among all age groups. The use of exception handling in Java is implemented so as to prevent the user from getting stuck at a process and understanding the use of the application in a more suitable manner. It eases the reading and understanding of naive runtime errors generated. The use of the multithreading concept in Java lets us use multiple threads at a single time and also lets us do multiple tasks simultaneously which is required in the banking system.

---

## Problem Statement

The motivation behind the project was the lack of a simple well-written application to access and modify the details of the bank accountants of a particular branch and the bank account holders at the same time. It gave us enough motivation to make a GUI based application solving the same. In a world like this, can a whole lot of the population afford to waste the time to look in for the details in the hardcopied registers and look for all the accountants and the account holders when they can be easily maintained as a simple application?

## Objective

The main objective of the project makes the user access the details of all the bank accountant the bank account holders. It also gives the accountant the authority to delete, modify the details of the account holders but the reverse is not possible because that's the hierarchy in a banking system works in that way. The aim is to give the accountant entire power virtually on the application. With our application we have achieved just that. The application could have been designed in many different ways, but we have produced a solution of an application that minimizes time complexity as well as space complexity by using Encapsulation, Polymorphism, Inheritance, and data abstraction. Along with these, Interfaces and various access modifiers have been implemented so as to maintain privacy and definition of access in different blocks Of code. The use of exception handling lets the user know exactly what went wrong.

---

## METHOD

The application works by reading all the accountants and the account holders from a different file, which can be updated by the proprietor of the application and also the same power is given to the admin of the bank. The file has the information stored in a particular format, which is decoded by the string reader functions in the code. Each time we enter or want a output from the file we have to read this string reader function which is an in-built function of java and can be directly used just by importing the required files. If there exists an object for the particular accountant or the account holder already, then that object is accessed, instead of creating a new one. If an object that is not available in the file is to be accessed then that object needs to be created and then accessed hence the access to that object is not allowed and hence access is denied. We have to make sure that the object we want to access is present in the file system otherwise we have to create an object. The usage of various JFrames also enables us to increase our scope and work beyond the limitations of the java by using the GUI effectively to give user an attractive interface to work with and get the work done.

---

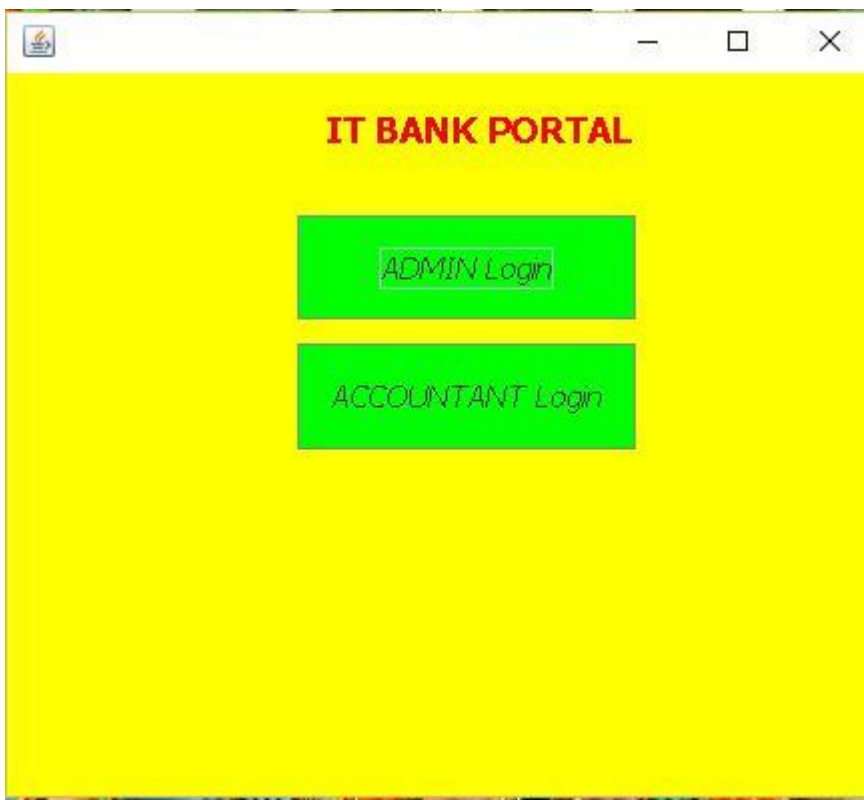

## SYSTEM REQUIREMENTS:-

- ☐ Eclipse platform for JAVA GUI (Graphic User Interface)
  - ☐ JDK(Java Development Kit)
  - ☐ Windows Operating System
-

---

## WORKS DONE :- (SCREENSHOT PF OUTPUT AND EXPLAINANTION)

### 1.Main Page:--

This is the main frame that will be displayed as soon as our project gets executed. This is also the first page and the directive page as it directs us either to the admin section or to the accountant section. It consists of two buttons ADMIN LOGIN AND ACCOUNTANT LOGIN.

---

---

## 2.Admin login page:--

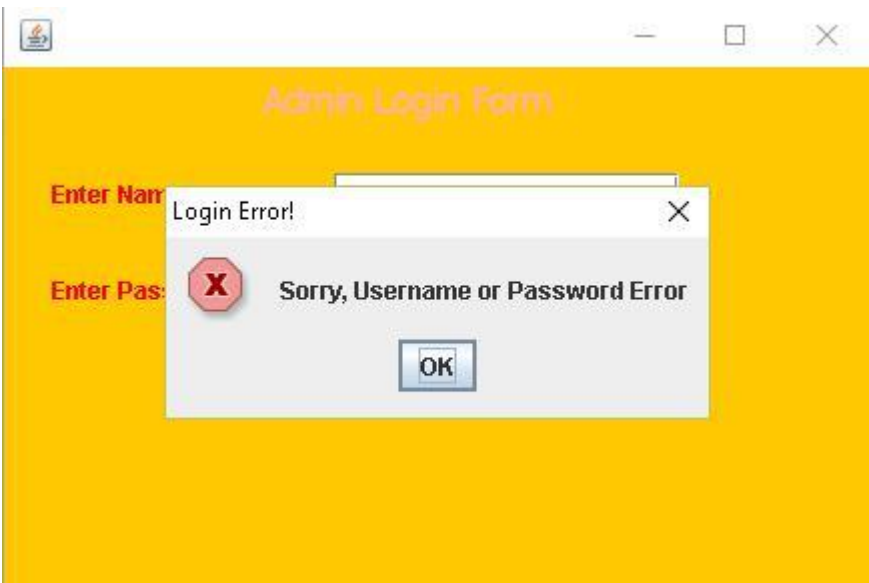

A screenshot of a web application window titled "Admin Login Form". The window has a yellow background. At the top, the title "Admin Login Form" is displayed in a light blue font. Below the title, there are two labels: "Enter Name:" and "Enter Password:", both in a dark red font. Each label is followed by a white text input field with a thin black border. Below the password field, there is a green rectangular button with the word "Login" in black text. The window has standard Windows-style window controls (minimize, maximize, close) in the top right corner.

This is the page that gets displayed as soon as the user clicks on the admin login button.

It consists of 2 labels namely enter name, enter password, one button, one text field and one password field to get the password. To hide the password we have here used the echo Code property of the password field to encrypt it.

---

### 3.Login Failed:--

This page gets displayed as soon as the user gets the name and the password on the frame admin login form but the dialog box with the message “Sorry, Username or Password Error” only when either the password or the name entered is incorrect.

#### 4.Admin login Section:--

This frame gets displayed when the user enters the correct name and the password. It has 4 different buttons which will direct to the things written on them. Only the ADMIN can enter the details of the Accountant and no one else. It consists of addition, viewing and removing of the accountant.

## 5.Add Accountant Page:--

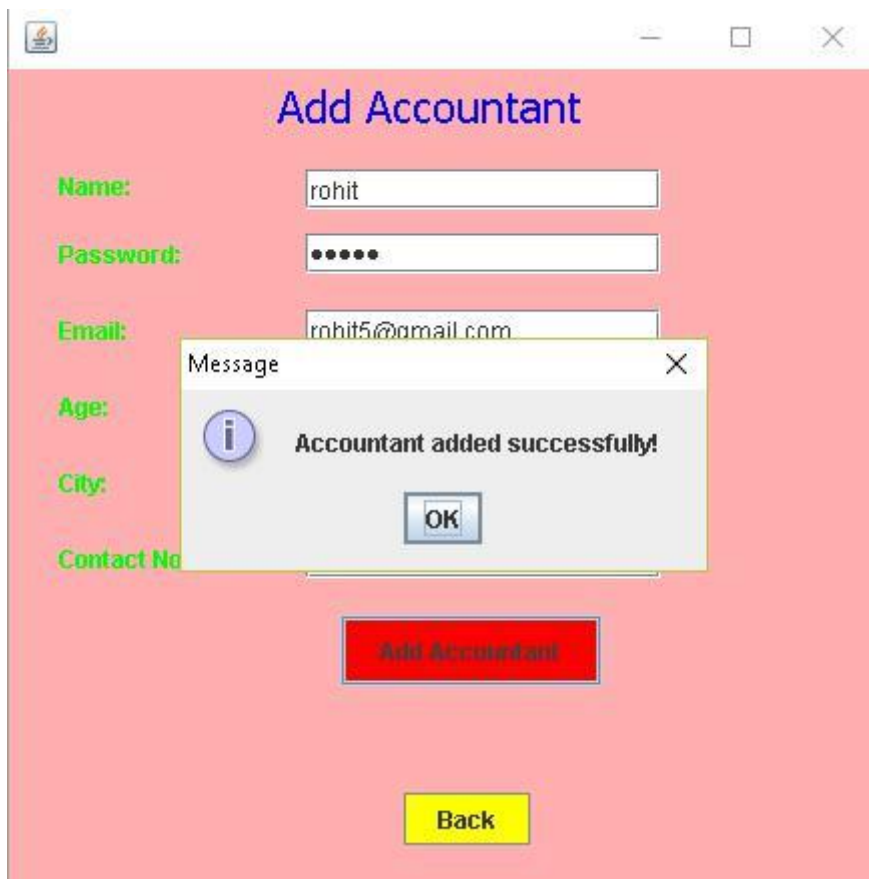

The screenshot shows a web browser window with a light pink background. At the top center, the heading "Add Accountant" is displayed in blue. Below the heading, there are six labels in green text, each followed by a text input field. The labels and their corresponding values are: "Name:" with "rohit", "Password:" with "\*\*\*\*\*", "Email:" with "rohit5@gmail.com", "Age:" with "23", "City:" with "kashmir", and "Contact No:" with "45678904". Below the input fields, there is a red button with the text "Add Accountant" and a yellow button with the text "Back".

Label	Value
Name:	rohit
Password:	*****
Email:	rohit5@gmail.com
Age:	23
City:	kashmir
Contact No:	45678904

This frame appears when the Accountant login button has been selected and the name and the password entered is correctly. This frame consists of the heading Add Accountant and it consists of 6 labels and 6 text fields and 2 buttons. This

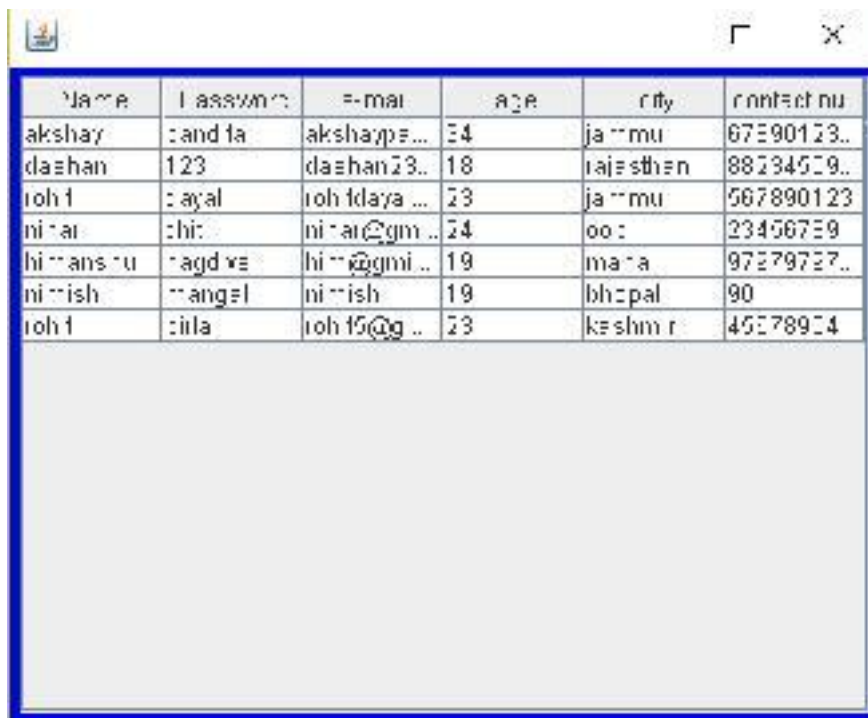

## 6.Accountant Added Successfully:--

This frame appears when accountant is added successfully.

This frame comes under admin section. It consists of a dialog box which is used making a `JOptionPane.showMessageDialog()` function.

## 7.Database of all accountants:--

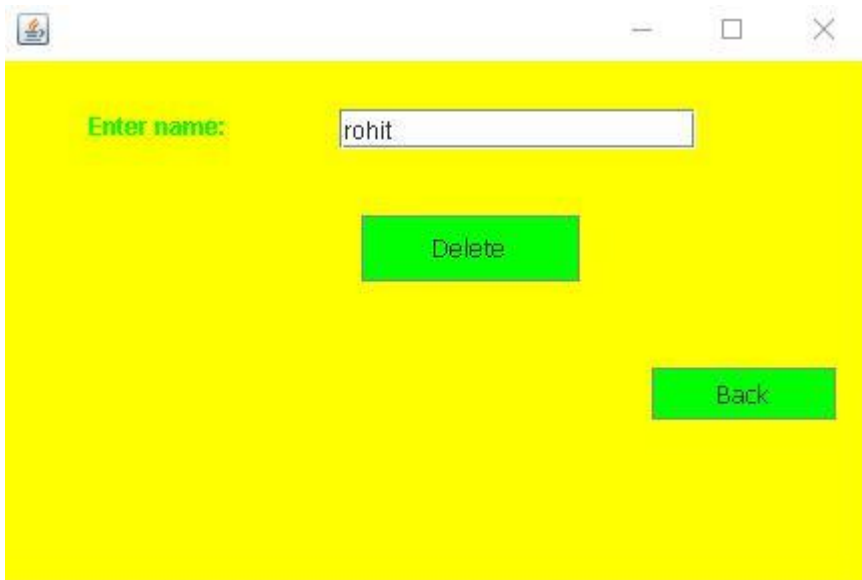

The image shows a screenshot of a database application window. The window has a title bar with a small icon on the left and standard window controls (minimize, maximize, close) on the right. Inside the window, there is a table with six columns: Name, Password, E-mail, Age, City, and Contact no. The table contains seven rows of data. Below the table, there is a large, empty rectangular area, likely for displaying query results or a form.

Name	Password	E-mail	Age	City	Contact no
akshay	bandita	akshayp@...	24	jammu	67890123..
dashan	123	dashan23..	18	rajessthen	88234567..
rohit	dayal	rohitdaya...	23	jammu	567890123
niraj	chit	niraj@gm...	24	oot	23456789
hitesh	agdev	hitesh@gmi...	19	matra	97879787..
nirish	mangel	nirish	19	bhopal	90
rohit	chila	rohit5@g...	23	kashmir	45678904

This is the database frame of all accountants under the institution.

This contains various information of the accountants.

## 8.Deleting an accountant:--

A screenshot of a web application window with a yellow background. The window has a title bar with a small icon on the left and standard minimize, maximize, and close buttons on the right. The main content area contains the text "Enter name:" in green. To the right of this text is a text input field containing the name "rohit". Below the input field is a green button labeled "Delete". To the right of the "Delete" button is another green button labeled "Back".

This frame comes under admin section.

This frame does the job of deleting an accountant.

This is in the control of admin whether to delete or not.

## 9. Record Deleted Successfully:--

This frame comes when record is deleted.

This frame confirms that record is deleted successfully.

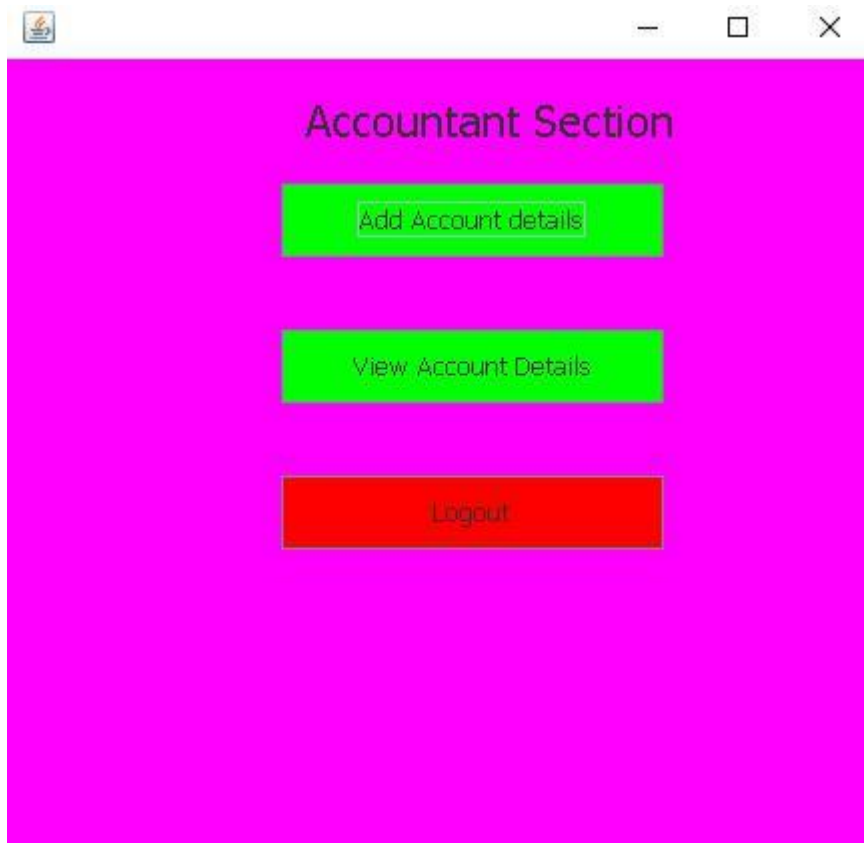

## 10.Accountant Login Form:--

A screenshot of a Java Swing window titled "Accountant Login Form". The window has a yellow title bar with standard minimize, maximize, and close buttons. The main content area has a light blue background. At the top center, the title "Accountant Login Form" is displayed in a green, stylized font. Below the title, there are two text input fields. The first field is preceded by the label "Enter Name:" in a blue font. The second field is preceded by the label "Enter Password:" in a blue font. Below the password field, there is a red rectangular button with the word "Login" written in white text in the center.

This frame can be chosen from main frame of the project.

In this frame name and password of accountant has to be given and if it is correct then accountant section frame pops up.

## 11.Accountant Section:--

This frame comes under the accountant's control.

In this Frame the accountant can add and view users.

## 12.Add Account section:--

The image shows a Java Swing window titled "Add ACCOUNT". The window has a yellow background and contains five text input fields with labels in red text. The labels and their corresponding values are: "Account Number:" with "45", "Name:" with "rohit", "Age" with "23", "State of belonging:" with "jammu", and "Salary" with "4000". Below the input fields, there are two buttons: a red button labeled "Add Account" and a green button labeled "Back". The window has standard Java Swing window controls (minimize, maximize, close) in the title bar.

Field Label	Value
Account Number:	45
Name:	rohit
Age	23
State of belonging:	jammu
Salary	4000

This frame appears when the button of add account is hit in the Accountant section.

This frame saves the user's various details in the database.

### 13.Account Added Sucessfully:--

The screenshot displays a web application window titled "Add ACCOUNT" with a yellow background. The form contains the following fields and labels:

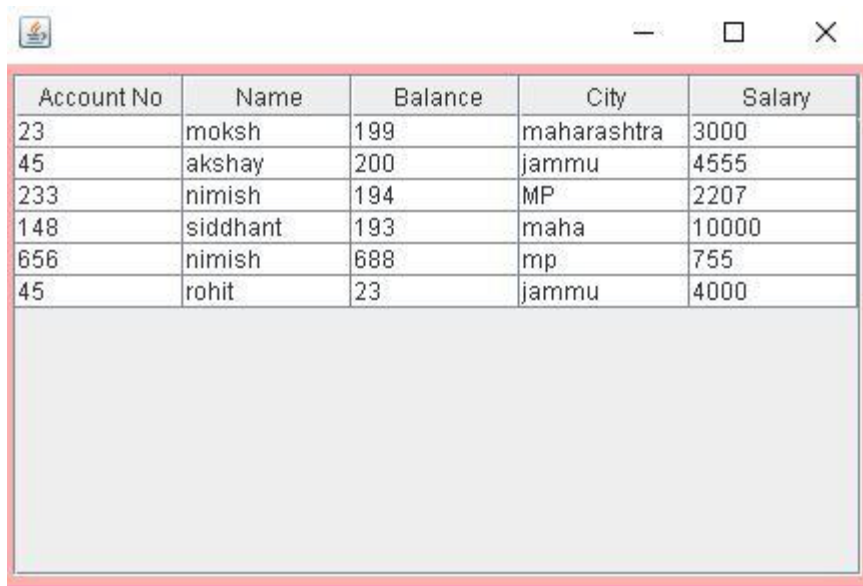

- Account Number:** 45
- Name:** rohit
- Age:** 23
- State of below** (partially visible)
- Salary** (partially visible)

Below the form, there is a red button labeled "Add Account" and a green button labeled "Back". A modal message box is overlaid on the form, titled "Message", with the text "Account added successfully!" and an "OK" button.

This frame confirms that user is added successfully.

This frame comes under accountant section.

## 14.Database of users:--

A screenshot of a database application window. The window has a title bar with a small icon on the left and standard minimize, maximize, and close buttons on the right. Inside the window, there is a table with five columns: 'Account No', 'Name', 'Balance', 'City', and 'Salary'. The table contains six rows of data. Below the table, there is a large, empty rectangular area, likely for a query editor or results pane.

Account No	Name	Balance	City	Salary
23	moksh	199	maharashtra	3000
45	akshay	200	jammu	4555
233	nimish	194	MP	2207
148	siddhant	193	maha	10000
656	nimish	688	mp	755
45	rohit	23	jammu	4000

This is the database of users.

This comes under accountant view section.

## FUTURE WORKS:-

- Since the project was made on a very basic level the obvious future work for the project would be to inculcate into it more complexities of the real life kind of banking system. Since the project we made was only for the students of the branch IT in its future work we can inculcate more branches too.
  
  - Another future work that might sound interesting is to provide a server to it and make it using database like MySQL(My Structured Query Language) which is a database used oftenly with Java to store the details and the contents into it. It will be relatively easier for both the user as well as the programmer to use MySQL instead of file management system , this is because in the file management system we have to distinctly code to read in a string or anything else but when using MySQL we can directly use the add ,delete and modify inbuilt functions of the MySQL database system and connect it to the Java program through server and then take in the command from user in java and then pass on the same command to MySQL. Java and MySQL can be connected to each other through database connectivity which basically connects them through server.
-

## RESULT AND DISCUSSION:-

The main result of the project is that we are now able to create a banking interface within a branch and between the accountants and the bank account holders. IT can also be used to display out the details of the users / bank account holders if we want to know something about them as and when we require.

The usage of JFrame also enables a good graphical user interface making the banking system look more attractive and hence more appealing to the user. Since we have used many components on the JFrame like the textfields, passwordfiels, radio buttons and other buttons. All the component within them contain a lot of properties which can further be used to make it more attractive and more user friendly and also more encrypted in a way hence ensuring the data encryption in the Java program.

## CONCLUSION:-

This was our project ever involving the connectivity of a language with the file management systems. This surely taught us a lot of things like how to store the details and how to look for the details in the backup database and how to create database and how to back up our data regularly. BY this project we ended up making a IT portal which has a important significance and is very essential to us all. Through this project we have gathered more knowledge about java, eclipse and file systems in java. WE also got to know a bit more about databases and how do we use them.

This project also taught us how to work in a team and taught us various leadership skills and how to coordinate in a team and get the work done.
